

## Wednesday Challenge Form

Group Members: Lucas, Rohin, and Armen

Problem Statement: find out how many  
Candy corns you can fit one sheet of paper.  
(candy corns are pointed upwards)

Approach: We first thought of taking a picture  
Of the example that drneato was going to show  
Us but then we decided that that would just be  
Cheating so we just calculated how many would  
Fit in the paper by using math. We divided the  
Area of the paper by the area of the candy corn  
And got a score of 548

Solution: In the end, the winning team had won  
By just taking a picture of the example.

Lessons Learned: Use any advantage you think  
You have.
